

**1.(a) What is the eval() method ?**

- The 'eval()' method in JavaScript is used to evaluate a string as if it were JavaScript code. It can take a string as an argument and execute the code contained in that string.

**(b) What is the purpose of prev() and next() method ?**

- In jQuery, the 'prev()' method is used to select the immediately preceding sibling of each element in the set of matched elements. The 'next()' method, on the other hand, is used to select the immediately following sibling of each element in the set of matched elements. These methods are helpful for navigating and manipulating the DOM.

**(c) How to delete all rows in a table except first row ?**

- To delete all rows in a table except the first row, we can use jQuery like this:  
`$("#yourTableID tr:not(:first)").remove();`
- This code selects all the rows in the table with the given ID except the first row (using the ':not(:first)' ) selector and remove them .
